### **REASONS FOR ALLOWANCE**

Claims 1-20 are allowable. The following is an examiner's statement of reasons for allowance:

With regards to claim 1, the examiner cannot find any applicable prior art and suggestion disclosing an occlusion release time when the occlusion state determine device determines that the used material changes its state from being hidden by the object body to not being hidden by the object; and an image an image content recognizing device that recognizes an image content including the motion of the player shown by the visual information based on the visual information obtained by the visual information obtaining device, a position of the used material at the impact time specified by the impact time information specifying device and the rule information stored in the rule information storing device in combination with the rest of the limitations of claim 1.

With regards to claims 17, 19 and 20 see the rationale for claim 1.

### **Relevant Art**

1. McNitt (US pat no 6,567,536): McNitt discloses an image recognition system that recognizes motions of players, comprising:

a visual information obtaining device that obtains visual information on which a motion of the player in at least one area during a match is shown from the content (figure 3, 350 includes a motion detector unit and a data acquisition unit); and

an impact time information specifying device that specifies an impact time when the used a material is hit based on an occlusion time when the occlusion state determining device determines that the used material changes its state from not being hidden to being hidden by the object (figure 3, 326, is element recording time stamp of impact times).

McNitt does not disclose occlusion release time when the occlusion state determining device determines that the used material changes its state from being hidden by the object body to not being hidden by the object; McNitt only discloses one type of impact time which is the time recorded during impact.

2. Harmath (US pat no 2002/0122115): Harmath discloses a system for judging boundary lines on a court in sporting games and determining whether a ball in play bounces in or out of court (figure 3, 11 element is judging unit to decide ball is in or out). The system comprises at least one camera to capture as frames movement of the ball and a frame grabber associated with each of the cameras to process the frames (figure 1, 10). An image processing system is configured to receive the digitized frame from the frame grabbers and to process the digitized frame to determine whether the ball is in or out of court and to generate a signal if the ball is out of court (figure 3, 11). There is an output device coupled to the image processing system to receive the signal and alert the players (paragraph 28 and figure 2, 26 are lighting output indicators).

3. Nguyen (US pat no 6,072,494): Nguyen discloses a system and method are disclosed for providing a gesture recognition system for recognizing gestures made by a

moving subject within an image and performing an operation based on the semantic meaning of the gesture. A subject, such as a human being, enters the viewing field of a camera connected to a computer and performs a gesture, such as flapping of the arms (figures 2 and 3). The gesture is then examined by the system one image frame at a time and positional data is derived from the input frames and compared to data representing gestures already known to the system (figure 5a, 504). The comparisons are done in real-time and the system can be trained to better recognize known gestures or to recognize new gestures (figure 5a, 502), reads on a rule information storing device stores rule information to conduct the relevant sport, and an image content recognizing art that recognizes an image content including motion of the person being imaged (each gesture recognized is read as motion of player), but the person does not hold a racket or a sport equipment which reads on 'material' in claimed invention.

4. Matsuo (US pat no 6,215,890): Matsuo discloses a hand gesture recognizing device is provided which can correctly recognize hand gestures without requiring users to be equipped with tools (figures 7a-c, three images are taken instead of using tools). A gesture of a user is stereoscopically filmed by a photographing device 1 and then stored in an image storage device 2 (figure 4). A feature image extracting device 3 transforms colors of the stereoscopic image data read from the image storage device 2 in accordance with color transformation tables created by a color transformation table creating device 13 (figures 7a-c), and disassembles and outputs the feature image of the user in corresponding channels. A spatial position calculating device 4 calculates

spatial positions of feature devices of the user by utilizing parallax of the feature image outputted from the feature image extracting device 4. A region dividing device 5 defines the space around the user with spatial region codes (figure 12). A hand gesture detecting device 6 detects how the hands of the user move in relation to the spatial region codes (figures 15, 16 and 25 show movement codes). A category is detected first on the basis of the detected hand gesture, and then a sign language word in that category is specified (figures 22a-c).

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
